Overview and Characteristics of Fan

**Overview**

A cooling fan is widely used to extend life of your system by cooling off heat of the system that many electrical components are mounted in a very high density and dissipating heat. Since we SANYO DENKI developed “San Ace” which is the first AC fan in Japan in 1965, we have increased fan motor lineup until now meeting customer’s needs rapidly based on our tremendous career. We SANYO DENKI will continue to develop new fans with high airflow, low noise, low vibration, and energy-saving design.

**Characteristics**

We can roughly divide fan into two types which are AC and DC.

**AC fans**

SANYO DENKI succeeded in the mass-production of AC fans in 1965. SANYO DENKI was the first Japanese manufacturer to have succeeded at this.

- High performance
- High reliability
- Safety

SANYO DENKI currently has a wider variety of products like Long Life Fan, CPU cooler, Splash Proof Fan, and Oil Proof Fan etc to meet all customer needs.

**DC fans**

SANYO DENKI succeeded in the mass-production of DC fans in 1982.

- High performance
- Low power consumption
- Low vibration
- Low leakage of flux
- High reliability

Guideline in Selecting a Fan

**How to select an appropriate fan**

The following example is a guideline regarding how to select an appropriate fan for cooling your system.

1. **Determining of your system specifications and conditions**

   Determine the temperature rise inside your system and obtain the total heating value inside your system on the basis of its inputs and outputs.

   Example
   - $V$: Total heating value of your system (W) = 100 (W)
   - $\Delta T$: Inside temperature rise (K) = 15 (K)

2. **Calculating the required airflow for cooling**

   After the equipment specifications and conditions of your system have been determined, calculate required airflow to meet the conditions.

   (Note that the formula shown below only applies when the heat radiation is performed only by cooling air from the fan.)

   Example
   - $Q'$: Motion airflow (m³/min)
   
   $$Q' = \frac{V}{20 \Delta T} = \frac{100 (W)}{20 \times 15 (K)} = 0.33 \text{ (m³/min)}$$

3. **Selecting the fan**

   After the motion airflow has been calculated, select an appropriate fan motor based on the value. The motion airflow when the fan motor is actually mounted in your system can be obtained using the airflow-static pressure characteristics curve and system impedance. However, the system impedance cannot be measured without a measuring equipment, so fan with 1.5 to 2 times higher airflow than the actual max airflow should be selected (operating airflow is one-third to two-thirds of maximum airflow).

   Example
   - $Q$: Maximum airflow (m³/min)
   
   $$Q = Q' \times 2/3 = 0.33 \times 2/3 = 0.22 \text{ (m³/min)}$$

Next, in case that you select a fan having an airflow of 0.5 (m³/min) or more and a appropriate size for the space inside your system.

For example, if you need a fan of 60 mm square, 25 mm thickness and 12 V, you should select 109R0612H402 (maximum airflow = 0.53 m³/min).

4. **Confirming the selected fan**

   Calculate the temperature rise inside your system when your system having 100 (W) of total heating value is forcefully cooled down by a 109R0612H402 fan.

   Example
   - $Q = Q' = 0.33 \text{ (m³/min)}$
   - $\Delta T = T/20Q' = 100 (W)/20 \times 0.33 = 14.2 (K)$

From the above, the temperature rise inside your system is calculated as 14.2 (K).

Since the value obtained from the above equation is only a rough target, final fan selection should be based on your actual installation test.
A cooling fan generally cools itself as well. The temperature rise of the motor is relatively low and the temperature rise of the grease in the bearings is also low, so expected life is longer than general some either motors. Since the service life of bearings is a theoretical value that applies when they are ideally lubricated, the life of lubricant can be regarded as expected life of the fan. DC fan consumes less power and its temperature rise of bearing is very low. When the measurement conditions are: L10 (the remaining product life in the lifespan test is 90%), with an atmospheric temperature of 60 degrees, at the rated voltage, and continuously run in a free air state. The table below indicates the relationship between ambient temperature and expected life estimated on the basis of our life tests and same other tests conducted by SANYO DENKI.

Noise characteristics

Noise is average value that measured at 1 meter away from air intake side of fan that is suspended on special frame in anechoic chamber (as per JIS B 8346).

Measuring airflow and static pressure

It is very difficult to measure airflow and static pressure. In fact, the performance curve may vary greatly according to the type of measuring equipment.

The commonly-used type of measuring equipment is a wind tunnel using a Pitot tube. SANYO DENKI uses a very precise method using double chamber equipped with many nozzles.

\[
Q = 60AV_f (A)
\]

where

\[
Q = \text{airflow (m}^3\text{/min)}
\]

\[
A = \text{cross sectional area of nozzle} = \frac{D^2}{4} (m^2)
\]

\[
D = \text{nozzle diameter}
\]

\[
V_f = \text{average airflow velocity of nozzle} = \sqrt{\frac{2P_n}{\gamma}} \text{ (m/s)}
\]

\[
\gamma = \text{Specific weight of air} = \frac{M}{g} \text{ (N/m}^3\text{)}
\]

\[
\rho = \text{Air density} = 1.2 \text{ kg/m}^3 \text{ at 20˚C, 1 atm}
\]

\[
g = \text{acceleration of gravity} = 9.8 \text{ (m/s}^2\text{)}
\]

\[
P_n = \text{differential pressure (Pa)}
\]

\[
P_s = \text{static pressure (Pa)}
\]

The measuring equipment using double chamber is method to be calculated from airflow goes through nozzle and differential pressure between pressure of inside of chamber (Ps) and atmospheric pressure by measuring differential pressure between air intake and exhaust of nozzle (Pn).

Conversion table

**Static pressure**

- 1 mm H₂O = 0.0394 inch H₂O
- 1 mm H₂O = 8.9 Pa (Pascal)
- 1 inch H₂O = 25.4 mm H₂O
- 1 Pa = 0.102 mm H₂O
- 1 inch H₂O = 249 Pa

**Airflow**

- 1 m³/min = 35.31 ft³/min (CFM)
- 1 CFM = 0.0283 m³/min
- 1 m³/min = 16.87 l/s
- 1 CFM = 0.472 l/s
- 1 l/s = 0.06 m³/min
Motor Protection

If the fan blades are restricted, an overcurrent occurs and leads to a rise in the fan coil temperature. This can result in reduced performance, damage, or a fire. To prevent this from occurring, SANYO DENKI’s fans incorporate an overheating protection function.

Reverse polarity protection function (DC fan)
No problem about fan even if positive & negative lead are connected in reverse. However, when wiring fans with sensors or PWM speed control function, connecting positive and negative leads in reverse may damage the fans.

Burnout protection function at locked rotor condition (DC fan, ACDC fan)
Current cutoff system
If the fan blades are restricted, the coil current is cut off at regular cycles to prevent overheating of the coil. When the hindrance is removed, the fan restarts automatically.

Burnout protection function at locked rotor condition (AC fan)
Impedance protection (60 mm sq., 80 mm sq., 92 mm sq., 120 mm sq.)
This system is used for shading coil-type fans. When the blades are restricted, the current is reduced by the impedance of the coil itself to prevent a temperature rise in the coil. However, if the applied voltage exceeds the specification range, an overcurrent can occur and result in overheating, and so care needs to be taken.

Thermal protection (160 mm sq., ø172 mm)
This system is used for condenser phase-type fans. A temperature sensor is incorporated in the coil so that if the temperature exceeds the specification temperature, the current is cut off to prevent overheating of the coil.
Specifications for DC Fan Sensors

**Pulse sensor (Tach output type) example**

Pulse sensor outputs two pulse waves per revolution of fan, and it is good to detect fan speed. Pulse sensors can be incorporated in all kinds of DC fans.

* Noise from inside the fan or from external devices may effect sensor output.

Contact us for more information.

The specifications listed below are for the 9G1212H101 model, and vary with the model number used. Please contact your point of sale for details.

**Output circuit**
Open collector

**Specifications**

\[ V_{ce} = +30 \text{ V max.} \]

(For a 48 V-rated fan: \( V_{ce} = +60 \text{ V max.} \))

\( I_{c} = 10 \text{ mA max.} \) [Vol=\( V_{ce} (\text{SAT}) = 0.4 \text{ V or less} \)]

Inside of DC fan:

![Resistor](SENSOR)

\( +30 \text{ V max.} \)

\( I_{c} = 10 \text{ mA max.} \)

Sensor output

* If you want detailed specifications that apply when the rotor is locked, please contact SANYO DENKI.

**Locked rotor sensor (rotation / lock detection type) example**

Locked rotor sensor outputs fan status signals. It is good to check whether the fan is running or locked.

* Noise from inside the fan or from external devices may affect sensor output.

* Regarding details of the reverse logic and specifications of lock sensor output signals, please contact SANYO DENKI.

* Lock sensor can not be used in some models. Contact us for more information.

The specifications listed below are for the 9G1212H1D01 model, and vary with the model number used. Please contact your point of sale for details.

**Output circuit**
Open collector

**Specifications**

\[ V_{ce} = +27.6 \text{ V max.} \]

For a 48 V fan: \( V_{ce} = +60 \text{ V max.} \)

\( I_{c} = 5 \text{ mA max.} \) [Vol=\( V_{ce} (\text{SAT}) = 0.6 \text{ V or less} \)]

For a 48 V fan: \( V_{ce} (\text{SAT}) = 0.4 \text{ V or less} \)

Inside of DC fan:

![Resistor](SENSOR)

\(+27.6 \text{ V max.}\)

\( I_{c} = 5 \text{ mA max.} \)

Sensor output

Note: The output is completely at Vol with 0.5 s or less after power-up.
Low-speed sensor (rotating speed detection type) example

Low-speed sensor outputs a signal when fan speed goes down to trip point or less. It is good to detect cooling degradation of fan.

- Noise from inside the fan or from external devices may affect sensor output, please.
- If you want detailed specification and reverse signal output, please contact SANYO DENKI.

*Low-speed sensors can not be used in some models. Contact us for more information.

The specifications listed below are for the 9G1212H1H01 model, and vary with the model number used. Please contact your point of sale for details.

**Output circuit**
Open collector

**Specifications**
- \( V_{CE} = +27.6 \text{ V max.} \)
- \( I_C = 10 \text{ mA max.} \) \[ \text{VOL} = V_{CE} \text{ (SAT)} = 0.5 \text{ V or less} \]

Fans with PWM Control Function

1. Overview

Pulse Width Modulation (PWM) control function enables you to externally control the speed of the fan by varying the duty cycles of PWM input signals between control and grounding terminals.

It allows fans to operate optimally in response to the device’s heat level, lowering the noise and power consumption of the system.

PWM control function has the following advantages:

1. Because the PWM signal is digitally input, precise control is possible.
2. Because the PWM signal is digitally input, multiple fans can be controlled.
3. Upon users request, how the fan speed responds to PWM signals can be customized. For example, fan can be set to stop or run at low speed at 0% PWM duty cycle.

2. PWM duty input signals and wiring diagram

Other than a TTL input, an open collector/drain input can be used for PWM signal input. Be noted that if an open collector/drain input is used or applied an input voltage and frequency is out of specified range, how the fan speed responds to the PWM duty cycle may be altered.

The input signal voltage and the frequency differ with models. Please contact us for details.

Example of input signal (TTL input)

- **Vin**: 4.75 to 5.25 V
- **VIL**: 0 to 0.4 V
- PWM duty cycle (%) = \( \frac{T1}{T} \times 100 \)
- PWM frequency 25 kHz = \( \frac{1}{T} \)
- Current source (Isource) = 1 mA max. (when control voltage is 0 V)
- Current sink (Isink) = 1 mA max. (when control voltage is 5.25 V)
- Control terminal voltage = 5.25 V max. (when control terminal is open)

When the control terminal is open, fan speed is the same as when PWM duty cycle is 100%.

3. PWM duty cycle – Speed characteristics

Fan speed of PWM control fans change, as the below performance curve shows, in response to the PWM duty cycle input.

If necessary, users can do the speed setting by themselves, making the fans operate at the optimum speed.

Also, upon user’s request, how fan speed responds to a PWM signal can be customized so that the fan stops or runs at low speed for a certain PWM duty cycle input. The below performance curve is for a fan that stops at 0% PWM duty cycle. Specifications differ with models. Please contact us for details.

The dotted part of the performance curve (area below 20% PWM duty cycle in the above case) indicates the fan speed is unstable in the area.

4. When you wish to obtain a fan performance with 100 or 0% PWM duty cycle without a PWM signal generator for built-in test.

Performance at 100% PWM duty cycle: Leave the control lead wire open and no connection.

Performance at 0% PWM duty cycle: Connect the control lead wire directly to ♂ pin.

5. Application examples of PWM control fan

Here are a few application examples of PWM control fan.

1. This system controls the fan speed in response to changing device temperature.

   By combining a PWM control circuit and thermistor that detects temperature of device and its parts, it is able to control the fan speed of PWM control fan in response to the changing temperature.
San Ace PWM Controller

- **Features**

  **Reduces system power consumption and fan noise**
  For PWM fan speed control, a PWM control circuit needs to be newly designed and configured.
  By using this product, however, PWM control function fans can be fully utilized without the need for preparing new circuits, contributing to reducing the system power consumption and the fan noise.

  **Can be common-powered by the fan power supply**
  The controller can be powered by the fan power supply of rated voltage 12, 24, and 48 VDC, and no separate supply is required.

  **Maximum of four fans connectable**
  Up to four fans with PWM control function can be connected and controlled.

  Please refer to page 500 for detail.
Splash Proof Fan

Ingress protection ratings (IP code)

- IP Codes used by SANYO DENKI express the level of protection that internal electrical components (for fans: electrical components and motor coils) have against solid objects, water, and access to hazardous parts. San Ace Splash Proof fans feature high protection levels.

- **Definition of Ingress Protection (IP Code)**

  Ingress Protection (IP Code) is defined in IEC (International Electrotechnical Commission) 60529*

UPS, inverter, rectifier, high-voltage power supply, etc.

Cautions for Use of a Cooling Fan in the Vicinity of a Power Switching Circuit (prevention of electrolytic corrosion)

If a fan is installed near a large-power or high-voltage switching circuit, the heavy electromagnetic noise resulting from electromagnetic induction in such circuits or the influence of high-frequency noise imposed through the power line of the fan may induce current through the shaft bearing of the fan. Such current may damage the oil film on the bearing and even the friction surface of the bearing. This adverse effect is known as “electrolytic corrosion of the fan.” Electrolytic corrosion affects the smooth revolution of the fan and may reduce its service life. An audible symptom is unusual noise emitted from the fan. This adverse effect is often observed and may partly be explained by the practice of mounting high-density parts, which reduces the gap between the switching circuits and the fan and the use of higher switching frequencies apt to provoke induction. Data processing/communications devices that operate at low voltages are not liable to electrolytic corrosion since they generate less electromagnetic noise.

A Case of electrolytic corrosion

Fans without anti-corrosion features installed near components that generate electromagnetic noise, such as inverter controllers, are liable to experience electrolytic corrosion.

</tbody>
</table>

Occurrence of electrolytic corrosion Pattern 1

(1) The fan gets charged with high-frequency electricity by high-frequency noise (electric field/magnetic field) generated in the switching circuit.
(2) Because of high-frequency electricity charged in the fan, an electric current flows through the bearing of the fan.
(3) The electric current breaks the oil membrane on the surface of the bearing and the bearing gets abraded (electrolytically corroded).
(4) This symptom often occurs in equipment in which switching circuits are spaced up and implemented in high density.
(5) Countermeasure 1: To provide a shield plate* inside the fan (The plate should be such that does not interfere with airflow).
(6) Countermeasure 2: To use a fan with ceramic bearings.

Occurrence of electrolytic corrosion Pattern 2

(1) High-frequency electricity flows from the circuit board into the inside of the fan superimposed with the power line for the fan.
(2) High-frequency electricity that has entered into the fan flows through the bearing.
(3) Oil membrane on the surface of the bearing gets broken and the bearing gets abraded (electrolytically corroded).
(4) Countermeasure 1: To remove high-frequency component between terminals “a” and “b”, “a” and “e” and “b” and “e” of the power supply for the fan, or to insert a filter** into the power line for the fan.
(5) Countermeasure 2: To use a fan with ceramic bearings.
(6) Cables should be twisted in order to decrease induction to the power line for the fan.

* Shielding metal plate
** Filter

As an electromagnetic shield metal, “EMC Guard” is available from our company. [http://www.sanyodenki.co.jp/product/newfan/indexf.html](http://www.sanyodenki.co.jp/product/newfan/indexf.html)

Measure against electrolytic corrosion

- Relocate fans far from all electromagnetic noise sources.
- Attach an EMC guard to ordinary fans. This should have an effect on electromagnetic noise due to radiation.
- As a power supply, the fan is wired from a circuit for which noise is not superimposed.
- Against heavy electromagnetic noise (electromagnetic induction) and conductive noise from the power supply line for a fan, we recommend the use of an “Electrolytic corrosion proof fan” with ceramic bearing.

This cooling fan prevents electrolytic corrosion of bearings even under conditions where electromagnetic noise is generated. Electrolytic corrosion of ball bearings is prevented by using ceramic balls in ball bearings. The ceramic material is an insulating material. Manufacturable to meet specifications of all San Ace series fans.

Component diagram

Caution

Electrolytic Corrosion Proof Fan has been designed to prevent the electrolytic corrosion of ball bearings in the fan, but this does not guarantee that the fan will operate normally under conditions where there is strong electromagnetic noise. Please be sure to fully evaluate the value of fan malfunction due to noise in advance.
RoHS Directive
Since October 2012, all the products in this catalog have complied with the maximum concentration values of the hazardous substances referred to in the Annex II to EU RoHS Directive 2011/65/EU, * except for the exempted applications specified in the Annex III to the Directive. Please note that SANYO DENKI does not use exemption 7(c)-III: Lead in dielectric ceramic in capacitors for a rated voltage of less than 125 VAC or 250 VDC, for those products.
* Lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE)
RoHS Directive:
DIRECTIVE 2011/65/EU OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment

Eco-products
Efforts for designing Eco-products
As for product design, we are carrying out R&D to incorporate the latest energy-saving technologies into our new products. At the same time, we carry out product assessments to evaluate the environmental impact of products at each stage, such as component and material procurement, manufacture, distribution, use, recycling, and disposal. Newly developed products are compared with commercially available and existing products and are certified as Eco-products (Eco-design products) if they satisfy the specified evaluation standards. Eco-products are presented in catalogues and other materials with a LEAF symbol.

Life cycle assessment (LCA)
LCA is one of the techniques used to provide a general quantitative measure of levels of environmental impact including global warming that products have through their life cycles. We evaluate the environmental compatibility of a product using this method. Our rate of implementing LCA in our Ecoproducts was 90%.
Operating Precautions

Temperature conditions

Operating temperature: Refer to the specifications table for each model.
Storage temperature: -20 ~ +70°C / -30 ~ +70°C (Varies for each model / Non condensing)
* Rapid change in temperature may cause condensation. Prevent condensation when storing. Condensation may affect lubrication performance and insulation.

Power specifications

For the specification of rated voltage and voltage range, please check the catalog or drawing for the model number.
Use of voltage exceeding the specified range may lead to performance degradation, device failure, or fire hazards. Do not apply voltage that exceeds specifications to the fan.
An electronic circuit is used for the DC fan. For power supply, use power with ripple less than 5% with low line noise and surge to prevent electronic circuit trouble.

Handling precautions

The fan motor is equipped with a precision ball bearing. Therefore, please handle the motors carefully in order not to shock the bearings.

Installation tips

There are no limitations on the installation direction of fans or blowers. Fans have symbols on the fan indicating the airflow direction and blade rotation direction. When installing, use these symbols to check the airflow direction.

Recommended screw torque

This shows the recommended values for the screw torque when installing the fans. If the tightening torque is higher than the recommended values, the fan can be deformed or damaged.
Use care when tightening. Also, be sure to always use a fan with a ribbed structure when securing by screws with both flanges.

Comparison of ribbed and ribless structures

Regarding plastic frame, we have a option ribbed and ribless about mounting. Please use preferred type up to your application. Please use ribbed fan in case that you hook fan up clamping either side fan mounting hole target. (According to the model, only models with or without ribs are available.)
* Use a fan with a rib structure when securing by screws with both flanges.

*When securing screws to ribless plastic frame models, use a flange to secure on one side.
Fan Mounting Using Self-tapping Screw

Installing self-tapping screws into the plastic frame of the fan may split or deform it. If using self-tapping screws, use screws that are recommended by our company, and refer to our recommended tightening torques and recommended pilot hole shapes. Pay close attention to the operating precautions and fully understand your equipment before you use it.

**Recommended screw torques**

<table>
<thead>
<tr>
<th>Screw Type</th>
<th>Recommended Screw Torque [N·m]</th>
<th>Fan Mounting Hole Diameter [mm]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ribbed fan (Fig. A)</td>
<td>0.8 max.</td>
<td>ø3.5, ø4.3, ø4.5</td>
</tr>
<tr>
<td>Counter rotating fan (Fig. B)</td>
<td>0.6 max.</td>
<td></td>
</tr>
</tbody>
</table>

Do not use self-tapping screws in the following cases:
- For ribless fans (except for counter rotating fans)
- When mounting finger guards on fans
Using self-tapping screws could deform or split the frame. Please use regular screws.

**Recommended pilot hole shape**

</tbody>
</table>

**Operating precautions**

- Place the self-tapping screw so that it is vertical and centered with the frame mounting hole (Fig. A) and then screw it in. The self-tapping screw could deform or split the frame if you screw it into the frame when the screw is not vertical.
- Screw in the self-tapping screw with the center of the mounting hole on the fan and the center of the pilot hole on the mounting plate aligned (Fig. B). Misaligned holes could lead to the frame being deformed or split.

**Recommended screw manufacturer**

To purchase the screws, please contact the screw manufacturer directly.
